

FRESH-AIRE UV™

UV LIGHT DISINFECTION SYSTEMS

UV Disinfection: A Proven Technology

Reduce Energy Consumption

According to the 2008 ASHRAE Handbook, because heat transfer and airflow are restored through the use of UVGI, energy savings can result, with the possibility of payback in less than two years.

Reduce Maintenance & Cleaning

Per Chapter 16, "Ultraviolet Lamp Systems," of the 2008 ASHRAE Handbook, chemical and mechanical cleaning of air conditioning coils and drain pans can be costly, dangerous, and even difficult. Applying UV light can help maintain system cleanliness by keeping surfaces free of microbial contamination.

Eliminate Mold, Bacteria & Viruses in the HVAC System

UV light appears to be an effective way to lower the risk of infection in the operating room during total joint replacement surgery.

Source: The Journal of Bone and Joint Surgery (American), 2007.

Reduce Ice Machine Maintenance

Field studies confirm that the Fresh-Aire Ice UV system™ reduces biological contamination in ice machines.

Source: Independent Certified Indoor Environmental Consultant Field Study, Summer 2008.

UV light technology has been recognized for its benefits and energy savings in the following industry and government handbooks:

ASHRAE

2008 HVAC Handbook, Chapter 16, "Ultraviolet Lamp Systems"

National Air Filtration Association

NAFA

2007 Guide To Air Filtration, Fourth Addition, Chapter 14

USGSA

2003 Facilities Standards for the Public Building Service, Chapter 5.9.

Since 2000, in every GSA-funded new construction project, GSA requires UV light to be applied to all coils and drain pans of every HVAC system.

Maintain Peak System Efficiency

As stated by the 2008, ASHRAE Handbook, UV light makes it easy to maintain heat exchange efficiency, design airflow and to improve indoor air quality.

Cut Airborne Biohazards

The Centers for Disease Control recognizes UV as a viable means for the reduction of tuberculosis and in reducing the transmission of other infections in hospitals, military housings and classrooms. Source: CDC, October 1994.

A microbial analysis of 54 air conditioning units at nine schools in California indicated a notable reduction in the levels of microbial growth on the evaporator coils; and total fungal and gram positive bacteria reductions were from 65 to 100% of colony forming units.

Meets LEED Accreditation

Saves Money By Increasing Air System Efficiency

Improves Indoor Environmental Quality

Increases Equipment & System Longevity

A **Fresh-Aire UV™** light system reduces microbial growth, allowing the system to run at peak efficiency and improves indoor environmental quality in residential, commercial and industrial applications by preventing mold, mildew, bacteria and viruses from collecting inside air conditioning and ice making systems.
